## SUPPLEMENTARY TABLES

## Supplementary Table 1. List of the 44 frailty items and the scoring used for construction of frailty index (FI).

| No. | Frailty item | Scoring |
| :---: | :---: | :---: |
| 1 | General health status | $\begin{gathered} \text { Excellent=0; Good=0.25; Average=0.5; Not so } \\ \text { good=0.75; } \mathrm{Bad}=1 \end{gathered}$ |
| 2 | Health status prevents from doing things normally would like to do | Not at all=0; To some extent=0.5; <br> A great deal=1 |
| 3 | Serious infections per year (other than respiratory) | $0-1$ time $=0 ; 2-5$ times $=0.5 ; \geq 5$ times $=1$ |
| 4 | Buzzing in ears | No=0; One ear/ both ears=1 |
| 5 | Angina pectoris | No=0; Yes=1 |
| 6 | Heart attack | No=0; Yes=1 |
| 7 | Heart failure | No=0; Yes=1 |
| 8 | High blood pressure | No=0; Yes=1 |
| 9 | Lipid disorder (e.g. high cholesterol, high triglycerides) | No=0; Yes=1 |
| 10 | Vascular spasm in legs (intermittent claudication) | No=0; Yes=1 |
| 11 | Clot in leg (venous thrombosis) | No=0; Yes=1 |
| 12 | Cerebral hemorrhage or clot in brain (stroke) | No=0; Yes=1 |
| 13 | TIA attacks (temporary weakness, paralysis or reduction of sensibility) | No=0; Yes=1 |
| 14 | Irregular cardiac rhythm/ atrial fibrillation | No=0; Yes=1 |
| 15 | Chronic lung disease (incl. chronic bronchitis, emphysema) | No=0; Yes=1 |
| 16 | Dizziness | No=0; Yes=1 |
| 17 | Rheumatoid arthritis | No=0; Yes=1 |
| 18 | Knee joint problem | No=0; Yes=1 |
| 19 | Sciatica | No=0; Yes=1 |
| 20 | Osteoporosis | No=0; Yes=1 |
| 21 | Hip joint problem | No=0; Yes=1 |
| 22 | Back pain | No=0; Yes=1 |
| 23 | Neck pain | No=0; Yes=1 |
| 24 | Diabetes (incl. old age diabetes; excl. pregnancy diabetes) | No=0; Yes=1 |
| 25 | Goiter | No=0; Yes=1 |
| 26 | Glandular diseases (excl. goiter) | No=0; Yes=1 |
| 27 | Gall bladder problem | No=0; Yes=1 |
| 28 | Liver disease (e.g. cirrhosis) | No=0; Yes=1 |
| 29 | Gout | No=0; Yes=1 |
| 30 | Kidney disease | No=0; Yes=1 |
| 31 | Stomach or intestine problems | No=0; Yes=1 |
| 32 | Recurring urinary tract problems | No=0; Yes=1 |
| 33 | Cancer, tumor disease or leukemia | No=0; Yes=1 |
| 34 | Migraine | No=0; Yes=1 |
| 35 | Asthma | No=0; Yes=1 |
| 36 | Allergy | No=0; Yes=1 |
| 37 | Recurrent periods of coughing | No=0; Yes=1 |
| 38 | Feeling depressed during the past week | Never/ almost never=0; Seldom=0.5; Often/ always/ almost always $=1$ |
| 39 | Feeling happy during the past week | Never/ almost never=0; Seldom=0.5; Often/ always/ almost always $=1$ |
| 40 | Feeling lonely during the past week | Never/ almost never=0; Seldom=0.5; Often/ always/ almost always $=1$ |
| 41 | Physical handicap | No=0; Yes=1 |
| 42 | Crohn's disease or ulcerative colitis | No=0; Yes=1 |
| 43 | Vision | Good=0; Reduced=0.5; Highly reduced/ blind=1 |
| 44 | Hearing | Good=0; Reduced=0.5; Highly reduced=1 |

Supplementary Table 2. Unadjusted phenotypic correlations, intraclass correlations and cross-twin cross-trait correlations for frailty index (FI), body mass index (BMI) and education.

| Zygosity | Phenotypic correlations |  |  | Intraclass correlations |  |  | Cross-twin cross-trait correlations |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | FI and BMI | FI and Education | FI | BMI | Education | FI and BMI | FI and Education |
| Total | $0.13(0.12,0.14)$ | $-0.17(-0.18,-0.16)$ |  |  |  |  |  |
| MZ | $0.12(0.09,0.14)$ | $-0.17(-0.19,-0.15)$ | $0.53(0.51,0.56)$ | $0.69(0.67,0.70)$ | $0.71(0.69,0.72)$ | $0.09(0.07,0.12)$ | $-0.16(-0.18,-0.13)$ |
| DZ | $0.14(0.13,0.15)$ | $-0.17(-0.18,-0.16)$ | $0.23(0.21,0.25)$ | $0.24(0.22,0.26)$ | $0.50(0.49,0.52)$ | $0.07(0.06,0.08)$ | $-0.16(-0.17,-0.15)$ |
| MZ males | $0.11(0.08,0.14)$ | $-0.17(-0.20,-0.14)$ | $0.47(0.43,0.51)$ | $0.66(0.63,0.68)$ | $0.69(0.67,0.72)$ | $0.09(0.05,0.12)$ | $-0.14(-0.17,-0.10)$ |
| MZ females | $0.16(0.13,0.19)$ | $-0.18(-0.21,-0.15)$ | $0.55(0.52,0.58)$ | $0.69(0.67,0.71)$ | $0.72(0.70,0.74)$ | $0.14(0.11,0.17)$ | $-0.17(-0.20,-0.14)$ |
| DZ males | $0.10(0.07,0.12)$ | $-0.17(-0.19,-0.15)$ | $0.19(0.15,0.23)$ | $0.27(0.24,0.31)$ | $0.50(0.47,0.53)$ | $0.03(0.00,0.06)$ | $-0.15(-0.18,-0.13)$ |
| DZ females | $0.20(0.18,0.22)$ | $-0.17(-0.19,-0.15)$ | $0.28(0.25,0.31)$ | $0.32(0.29,0.35)$ | $0.57(0.55,0.59)$ | $0.12(0.09,0.14)$ | $-0.16(-0.19,-0.14)$ |
| DZ opposite-sex | $0.10(0.08,0.13)$ | $-0.17(-0.19,-0.15)$ | $0.21(0.18,0.23)$ | $0.18(0.16,0.21)$ | $0.47(0.45,0.49)$ | $0.03(0.00,0.06)$ | $-0.14(-0.17,-0.12)$ |

Note: MZ, monozygotic twins; DZ, dizygotic twins. Phenotypic correlations are the within-individual correlations between FI and BMI, and between FI and education. Intraclass correlations indicate the extent to which each trait correlates within twin pairs. Cross-twin cross-trait correlations show the extent to which FI of the first twin correlate with the other trait (i.e. BMI or education) of the second twin. $95 \%$ confidence intervals are presented in parentheses.

Supplementary Table 3. Model fitting results from bivariate models of frailty index (FI) with body mass index (BMI) and education.

| Model | -2LL | df | AIC | $\Delta \mathbf{L L}$ | $\Delta \mathrm{df}$ | $p$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| No sex difference | 198315.7 | 54185 | 89946 | 206.7 | 35 | $3.18 \times 10^{-26}$ |
| AE bivariate |  |  |  |  |  |  |
| Quantitative sex-limitation | 198328.3 | 54188 | 89952 | 219.3 | 38 | $2.39 \times 10^{-27}$ |
| No sex difference | 198360.8 | 54192 | 89977 | 251.8 | 42 | $1.02 \times 10^{-31}$ |

Note: AIC, Akaike's Information Criterion; LL, log-likelihood; df, degrees of freedom; $p, p$-values of likelihood ratio tests compared with the saturated models. Opposite-sex twins were excluded in the bivariate analyses. All bivariate models between FI and education had significant worse model fit than the saturated model, since an ADE model fits better for FI while an ACE model fits better for education. During assumption testing, equating means of education across zygosity resulted in a significantly worse fit of data compared to the saturated model; therefore, means of education were estimated separately across zygosity in bivariate models between FI and education. All models were adjusted for age (as linear effect for FI, and linear+quadratic effect for BMI and education). Best-fitting models are shown in bold, and the parameter estimates of these models are presented in Supplementary Table 4.

Supplementary Table 4. Parameter estimates ( $95 \% \mathrm{CI}$ ) from the best-fitting bivariate models.

| Model | Variance components |  |  |  | Genetic and environmental correlations |  |  |  | Bivariate heritability |  |  |  |

Note: BMI, body mass index; FI, frailty index; CI, Wald-type confidence interval; A, additive genetic factors; D, dominance genetic factors; $H$, total genetic factors/ broad-sense heritability; $C$, common environmental factors; $E$, unique environmental factors; $r$, correlation between variance components. M and F represents parameter estimates for men and women respectively. Bivariate heritability is the proportion of phenotypic correlation explained by genetic and environmental factors.

Supplementary Table 5. Model fitting results from moderation models of frailty index (FI) by body mass index (BMI).

| 14. Full moderation | 47823.0 | 20113 | 7597 | 12 | 29.6 | - | - |
| 15. Drop all moderation | 48064.9 | 20117 | 7831 | 14 | 241.9 | 4 | $3.69 \times 10^{-51}$ |

Note: AIC, Akaike's Information Criterion; Comp, model of comparison; df, degrees of freedom; LL, log-likelihood; $p, p$-values of likelihood ratio tests compared with the models of comparison. Opposite-sex twins were excluded in the models. Quantitative sex differences were allowed to obtain separate estimates for men and women. Bivariate models were adjusted for age (as linear effect for FI, and linear+quadratic effect for education); extended univariate models were adjusted for age, as well as education for both the individual and the co-twin. Best-fitting model is shown in bold. Due to the non-significant moderation on the covariance between FI and education in the bivariate models, the more parsimonious ADE extended univariate model was used.

Note: AIC, Akaike's Information Criterion; LL, log-likelihood; df, degrees of freedom; p, p-values of likelihood ratio tests compared with the saturated model. Cls are Wald-type confidence intervals with lower and upper bounds of 0 and 1. A, additive genetic factors; D, dominance genetic factors; C, common environmental factors; H , total genetic factors/ broadsense heritability; E , unique environmental factors; $r_{f m}$, genetic correlation between men and women, estimated using opposite-sex twins. M and F represents parameter estimates for men and women respectively. Full sex-limitation models allowed both quantitative and qualitative sex differences. In ADE quantitative sex-limitation model, $r_{f m}$ was fixed to be 1 . In ADE no sex difference model, broad-sense heritability of men and women were equated, but variance difference between sex was allowed. ACE and AE sub-models are not shown as the full models fit significantly worse than the saturated model. All models were adjusted for age. Best-fitting model is shown in bold.

Supplementary Table 8. Model fitting results and parameter estimates from univariate sex-limitation models of the frailty index (FI) using "direct symmetric approach.

Note: AIC, Akaike’s Information Criterion; LL, log-likelihood; df, degrees of freedom; p, p-values of likelihood ratio tests compared with the saturated model. Cls are Wald-type confidence intervals. Variance component estimates are allowed to be negative in the "direct symmetric approach" (Verhulst et al. 2019). A, additive genetic factors; D, dominance genetic factors; C, common environmental factors; H , total genetic factors/ broad-sense heritability; E , unique environmental factors; $r_{\mathrm{fm}}$, genetic correlation between men and women, estimated using opposite-sex twins. M and F represents parameter estimates for men and women respectively. Full sex-limitation models allowed both quantitative and qualitative sex differences. In ADE quantitative sex-limitation model, $r_{\mathrm{fm}}$ was fixed to be 1 . In ADE no sex difference model, broad-sense heritability of men and women were equated, but variance difference between sex was allowed. All models were adjusted for age. Best-fitting model is shown in bold.

* An ACE quantitative sex-limitation model cannot be fitted due to an issue with the expected opposite sex twin covariance of $\mathrm{V}(\mathrm{VCm}$ *VCf) (using notation from Verhulst et al.) when one common environmental component was negative, a problem identified in Verhulst et al. (2019).

| No sex difference | 198360.8 | 54192 | 89977 | 251.8 | 42 | $1.02 \times 10^{-31}$ |

Note: AIC, Akaike's Information Criterion; LL, log-likelihood; df, degrees of freedom; p, p-values of likelihood ratio tests compared with the saturated models. Variance component estimates are allowed to be negative in the "direct symmetric approach" (Verhulst et al. 2019). Opposite-sex twins were excluded in the bivariate analyses. During assumption testing, equating means of education across zygosity resulted in a significantly worse fit of data compared to the saturated model; therefore, means of education were estimated separately across zygosity in bivariate models between Fl and education. All models were adjusted for age (as linear effect for FI, and linear+quadratic effect for BMI and education). Best-fitting models are shown in bold, and the parameter estimates of these models are presented in Supplementary Table 10.

Note: BMI, body mass index; FI, frailty index; CI, Wald-type confidence interval; A, additive genetic factors; D, dominance genetic factors; $H$, total genetic factors/ broad-sense heritability; $C$, common environmental factors; $E$, unique environmental factors; $r$, correlation between variance components. $M$ and $F$ represents parameter estimates for men and women respectively. Bivariate heritability is the proportion of phenotypic correlation explained by genetic and environmental factors. Variance component estimates are allowed to be negative in the "direct symmetric approach" (Verhulst et al. 2019).

* Correlation between C or D components were not defined when the variance components are negative.
$\dagger$ The same conclusion can be drawn from either the ACE and ADE bivariate models between FI and BMI , in which there is a modest genetic correlation $\left(r_{H}\right)$ between FI and BMI , and their phenotypic correlation is mostly explained by genetic factors (bivariate H).
$\ddagger$ Although both ACE and ADE bivariate models have the same model fit when allowing for negative variances, the ACE bivariate model is more in line with the observed cross-twin cross-trait correlations (MZ twins: -0.07; DZ twins: -0.08, shown in Table 2) that the phenotypic correlation between FI and education is largely explained by common environmental factors (bivariate $\mathrm{C}=92 \%$ in men and $84 \%$ in women, slightly more than $65 \%$ and $74 \%$ using the standard approach). In contrast, the solution in the ADE bivariate model yielded a highly negative and non-sensical D component, and it causes all the common environmental influences on the covariance going to genetic factors - a result not in line with the standard interpretations of the observed cross-twin cross-trait correlations.
